

Doctor, is this normal?

0.1 ULAB, Division of Sincereley Serious Science

Thomas Hallal

1 Introduction

According to my sources, around May 2021 an image began circulating around the internet about a broken sidewalk. The image, which can be seen in Figure 1, claims that the sidewalk crack resembles the form of a normal distribution. This lab report will test that claim by fitting this curve with a normal standard distribution (also called a Gaussian distribution).

Figure 1: Sidewalk image from the internet.

2 Methods

2.1 Preprocessing

First, we used the Perspective Wrap tool in Photoshop to correct the titled perspective of the image. Then, we worked with the `Python Imaging Library` and `Numpy` [1] and converted our image to grayscale. A threshold mask was applied to the image so that only dark pixels would be retained. Note that some minimal manual

processing was required to remove the vertical sidewalk crack as well as outlier pixels. Finally, the location of the dark pixels are recorded as coordinates in a Cartesian plane.

2.2 Curve Fitting

$$f(x) = A \cdot \exp\left(-\frac{(x - \mu)^2}{2\sigma^2}\right) \quad (1)$$

3 Results

The result of the curve fitting is shown in Figure 2. The fitted data curve is presented in the following figure.

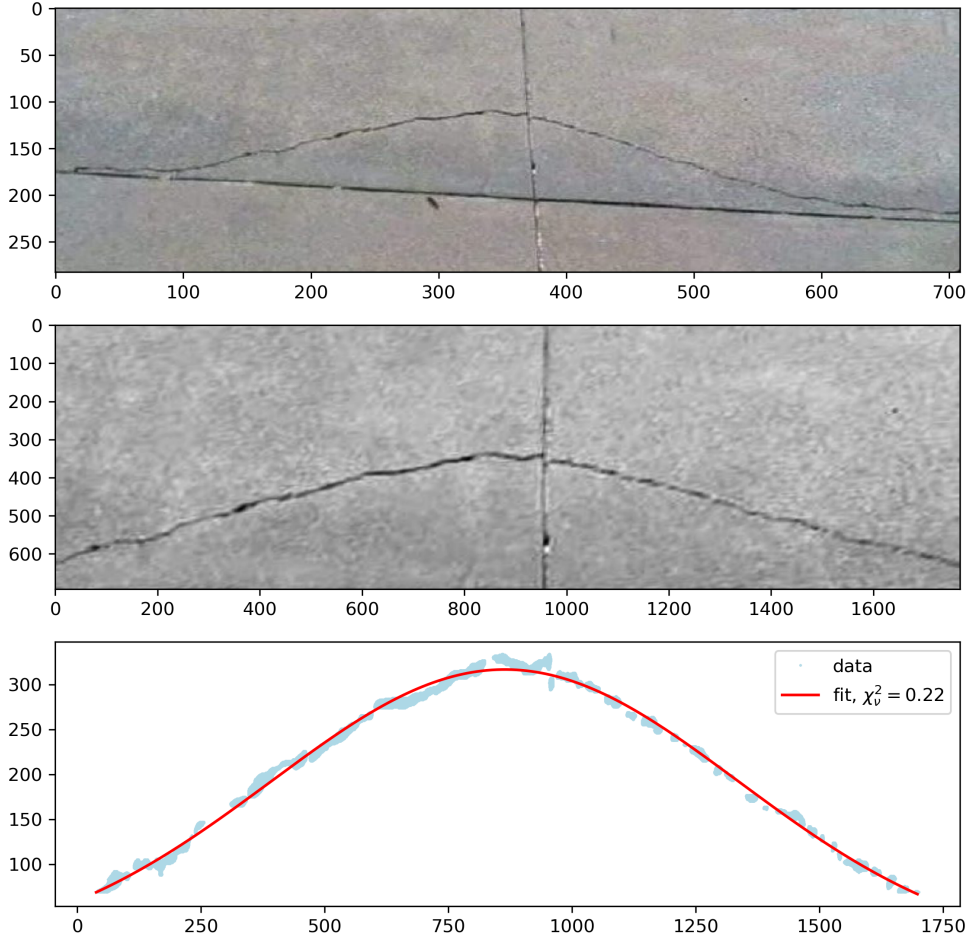

Figure 2: Top: original image, Middle: processed image with perspective correction and greyscale transformation, Bottom: curve fit of the sidewalk crack points.

$$\chi^2 = \frac{1}{\nu} \sum \frac{(O - E)^2}{E} = 0.22 \quad (2)$$

where ν is the number of degrees of freedom. Of note, we used the Pearson chi-squared definition because it is difficult to estimate the uncertainty of our points. 2

The reduced chi-squares is less than 1 and quite small.

Therefore, our model is likely correct but that the data is slightly over fitted.

Regardless, we have shown that the crack is well-described by a normal curve!
